***Abstract*—Citizens may find it difficult to get easily available information regarding the provisions and procedures in relation to their rights. NyayaAI is an multilingual agentic system that provides citizens of India access to constitutional information. Prototype implementation of the first phase of this system involves six agents for scope filter- ing, planning, information retrieval, rights analysis, evidence validation and response generation. The RAG technique with parent-child relationships for retrieving and augmenting generation uses the Constitution of India for response generation; multilanguage interface and cleanse of the Plan-Tool-Observe-Decide trace increases the accessibility and auditability of the system. Five more agents including consent-based lawyer matching, availability verification, scheduling and follow up using deterministic tools are proposed for the next phase of the work. We describe the architecture of the system, the research gap based on literature review and evaluation protocol using scenarios. Evaluation results of effectiveness of the system are not quantitatively provided.**

I. Introduction

Availability of legal information in India varies with regard to languages used and legal literacy level. Section 3 of the Constitution of India [1] guarantees the fundamental rights, but their actual understanding could require some more laws and cases. Language models (LLMs) can provide an answer to making legal information accessible, but they may have prob-lems with fabrication and misattribution of the content [2], [3]. Retrieval systems also have problems of hallucinations in legal studies [4], which implies the need for retrieval augmentation [5]. But this alone is not enough. Legal entailment and contract analysis [6], [7] provide motivations for evidence-aware legal NLP.

The two major problems which NyayaAI addresses are evidence based constitutional interpretation and a different approach for qualified human help. In the Stage 1 which has already been developed as a prototype, there is cooperation between six agents. In Stage 2 which is under development, there is cooperation between five more agents through purpose based consent. The four agents are (i) Article based Parent-Child Relationship Search, (ii) a specific Verification stage,
(iii) Multilingual interaction and Sanitized execution trace and (iv) Deterministic consent-based lawyer matching and scheduling.

II. Literature Survey

Legal NLP research conducted in India includes the use of Indian Legal Documents Corpus (ILDC) [8] and domain-adapted language models [9]. LexGLUE [10] and LegalBench
[11] measure the legal understand- ing and reasoning abilities, whereas case-law retrieval and long document methods are utilized for domain- tailored evidence management [12], [13]. General RAG [14] and hierarchical retrieval [15] assist in the con- text selection, whereas Self-RAG [16] and correct-ive RAG [17] in the reflection and retrieval quality. Agent utilization and collaboration can be realized by ReAct [18] and AutoGen [19] tools. Legal halluci- nation auditing [3],
[4] provides a rationale for verifi- cation.

A. Research Gap Analysis

Above-mentioned literature provides criteria for law, re-trieval and agents, and verification as separate issues. None of the evaluated systems, mentioned above, includes all of the following criteria: multilingual Indian constitutional retrieval, evidence verification before citation of the Articles, agent trail sanitization, and consent-based human escalation. It is a comparison which can't be used as an argument proving the nonexistence of such systems. However, all these criteria are applied by NyayaAI, but its efficiency has to be proved yet.

III. Problem Statement

As long as the citizen asked for the query q in the language l, the following will hold: Identification of legal coverage;

TABLE I
REPRESENTATIVE RESEARCH AND THE GAP RELEVANT TO NYAYAAI (LIMITATIONS ARE RELATIVE TO THIS APPLICATION)

Reference	Research contribution	Gap relative to NyayaAI
Malik et al. [8]	ILDC judgment prediction and explanation corpus	Judgment-centric rather than citizen-facing constitutional assis-tance
Chalkidis et al. [10]	LexGLUE English legal understanding benchmark	Benchmark, not an interactive assistance workflow
Guha et al. [11]	LegalBench reasoning evaluation tasks	Evaluation rather than deployed, evidence-grounded support
Paul et al. [9]	Indian legal-domain language modeling	Does not implement the proposed human escalation pathway
Gao et al. [14]	Survey of RAG approaches	General retrieval architectures; no specific consent workflow
Sarthi et al. [15]	RAPTOR hierarchical retrieval by recursive summaries	Not designed around constitutional Article citations
Asai et al. [16]	Self-RAG retrieval and self-critique	Does not address Indian constitutional legal assistance
Yao et al. [18]	ReAct reasoning and tool use	General agent pattern; lacks domain-specific privacy gateway
Wu et al. [19]	AutoGen multi-agent coordination	Framework, not a verified legal assistant
Dahl et al. [3]	Study of hallucinations in legal LLM responses	Diagnoses reliability risks rather than an escalation system
Magesh et al. [4]	Evaluation of AI legal research tool reliability	Motivates verification; does not provide this workflow

TABLE II
LITERATURE REVIEW SUMMARY OF RELATED WORK BY THEME

Ref.	Year	Theme	Contribution / method	Limitation for citizen-facing constitutional assistance
Malik et al. [8]	2021	Indian legal NLP	ILDC corpus for court judgment prediction and explanation	Focuses on judgments, not on citizen queries about constitu-tional rights
Paul et al. [9]	2023	Indian legal NLP	Pre-trained language models adapted to In-dian law	Model-level work; no retrieval, verification or human escala-tion
Chalkidis et al. [10]	2022	Legal benchmarks	LexGLUE benchmark for English legal un-derstanding	Benchmark only; English and not India-specific
Guha et al. [11]	2023	Legal benchmarks	LegalBench tasks for legal reasoning in LLMs	Evaluation suite, not a deployed assistant
Holzenberger et al. [6]	2020	Statutory reasoning	Tax-law entailment and QA dataset	Different jurisdiction and domain; no multilingual support
Koreeda and Manning [7]	2021	Contract analysis	ContractNLI for document-level inference on contracts	Contract-specific; does not target constitutional rights
Lewis et al. [5]	2020	RAG	Retrieval-augmented generation for knowledge-intensive tasks	General-purpose; no citation verification or legal scope control
Gao et al. [14]	2023	RAG survey	Survey of RAG paradigms and components	Survey; no consent workflow or legal domain design
Sarthi et al. [15]	2024	Hierarchical retrieval	RAPTOR tree-organized retrieval via recur-sive summaries	Not designed around Article-level citations
Asai et al. [16]	2024	Reflective RAG	Self-RAG: retrieve, generate and self-critique	Does not address Indian constitutional assistance
Yan et al. [17]	2024	Corrective RAG	Corrective retrieval to improve retrieval qual-ity	No legal-specific verification or human escalation
Yao et al. [18]	2023	Agents	ReAct: interleaved reasoning and tool use	General pattern; lacks a privacy and consent gateway
Wu et al. [19]	2023	Multi-agent systems	AutoGen multi-agent conversation framework	Framework, not a verified legal assistant
Dahl et al. [3]	2024	Legal hallucination	Profiles hallucinations of LLMs on legal queries	Diagnoses risk; proposes no escalation or verification system
Magesh et al. [4]	2025	Legal tool reliability	Evaluates reliability of AI legal research tools	Motivates verification; does not provide a workflow

Identification of constitutional evidence; Connecting of facts to relevant articles; Identification of text basis; Explanation of language . As long as there is a need to extend assistance using the humans, the following capabilities are to be guaranteed: Certified lawyers matching; Demonstration of available slots; Disclosure of cases information after permission.

IV. SYSTEM OVERVIEW

The NyayaAI system employs a state-directed graph via Lang-Graph [20]. In this directed graph, each node both reads and writes typed state consisting of query, language, plan, passages, candidate Articles, verification result, and tool result.

Fig. 1 compares the implemented phase for constitutional aid with the proposed phase for lawyer aid.

V. METHODOLOGY

A. Multilingual Input Processing

Input is possible via the text itself. Voice inputs are con-verted to text via Whisper-large-v3 [21], which uses work in multilingual speech recognition. The Constitution and BGE-small-en-v1.5 embedding [22] is English-based; questions in languages other than English are translated into an English question by the LLM. Answers are generated in English, Hindi, Marathi, Tamil, Telugu, and Bengali, with voice generation as well. Translation and cross-language retrieval performance

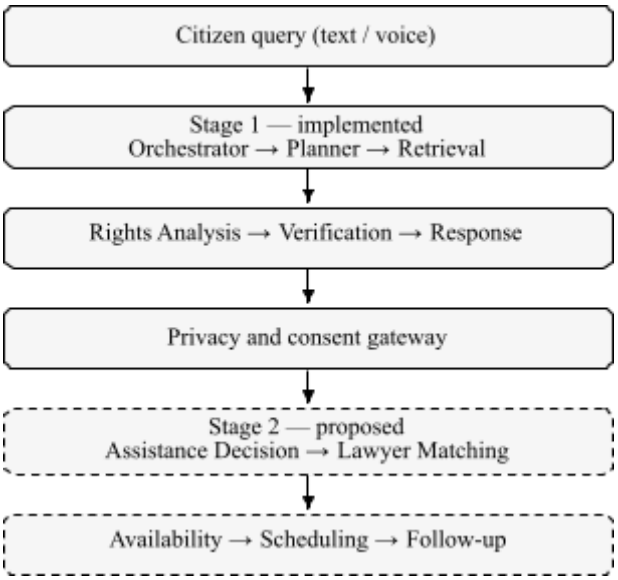

Fig. 1. NyayaAI architecture: implemented constitutional assistance and proposed human escalation.

Algorithm 1 Constitutional retrieval and verification

Require: Query q, language ℓ

if not InScope(q) **then**
  return rejection in ℓ
end if
$q' \leftarrow$ RetrievalQuery(q, ℓ)
$R \leftarrow$ TopKChildren(q', 4)
$P \leftarrow$ DistinctParents(R)
$M \leftarrow$ MapArticles(q, P)
$M' \leftarrow \{a \in M : \text{Verify}(a, P)\}$
if $M' = \varnothing$ **then**
  return no verified mapping + referral advice
end if
return Respond(q, M', P, ℓ) with citations and disclaimer

have not been evaluated yet; cross-language information re-trieval [23] would make an interesting comparison point.

B. Parent–Child Constitutional RAG

Constitution [1] has many pages, giving metadata about references. This file is organized into parent segments which are 2000 characters long without any overlap, breaking up the text according to the division of Article, Part, and Paragraph; the parent segments are further split into The embeddings of 400 characters of children share 50 characters between themselves. The embeddings of Children are persisted in the ChromaDB [24], with a pointer to its parent. The top $k = 4$ closest matches out of the characters of children based on cosine similarity are filtered out by the parent before any other processing (Fig. 2). An Article can have more than one parent, so completeness of the Article is desired but not assured. [15]. (search_constitution), Rights Analysis (Article candidates), Verification (Support checks), and Response (citation).

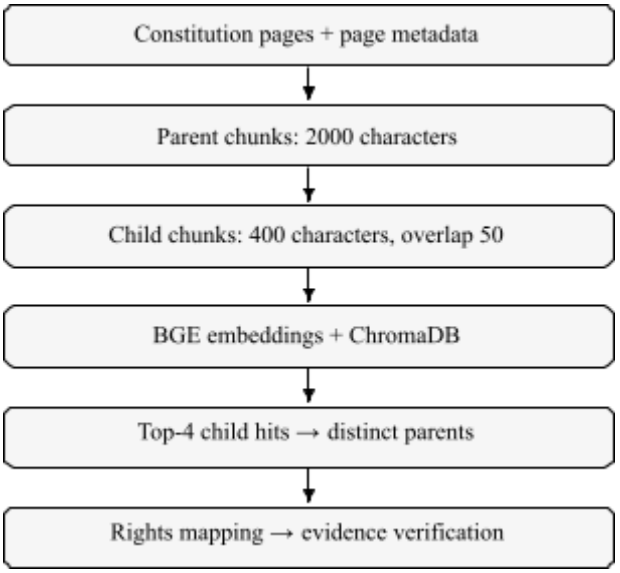

Fig. 2. Parent–child constitutional retrieval pipeline.

TABLE III
AGENT RESPONSIBILITIES AND IMPLEMENTATION STATUS

#	Agent	Role	Status
1	Orchestrator	Scope and intent	Impl.
2	Planner	Investigation plan	Impl.
3	Retrieval	Constitutional passages	Impl.
4	Rights Analysis	Article mapping	Impl.
5	Verification	Evidence checks	Impl.
6	Response	Cited multilingual answer	Impl.
7	Assistance Decision	Human-help routing	Prop.
8	Lawyer Matching	Verified candidate search	Prop.
9	Availability	Database-backed slots	Prop.
10	Scheduling	Conflict-free booking	Prop.
11	Follow-up	Consented reminders	Prop.

C. Evidence Verification

In the process of verification, all those mappings which lack any justification in terms of the sections of the constitution retrieved are either neglected or tagged. In case there is no mapping retained, the assistant will indicate that no verifiable mappings have been found and advises seeking professional assistance. Remedies in statute cannot be drawn only on the basis of what is present in the constitution; thus, the assistant should point out the limitations of its services. The verifier is also an LLM, hence it may neglect correct mappings and retain incorrect ones.

D. Explainability

The following execution log does not contain any of the uncleaned data anymore and contains plan, tool name and its input, observation, decision, and excerpts from pages but not the reasoning about personal knowledge of the model. For instance, *Plan*: Rights of detention; *Tool*: `search_constitution("police detention")`; *Observation*: Relevant excerpts found; *Decision*: Proceeding

Algorithm 2 Multi-agent control flow

Require: Query q, language ℓ, user u

$s \leftarrow$ Init(q, ℓ, u)
$s \leftarrow$ Orchestrator(s)
if s.intent = OUT_OF_SCOPE **then**
    return Reject(s)
end if
Run Planner, Retrieval, Rights Analysis
Run Verification and Response
Deliver(s.response)
$s \leftarrow$ AssistanceDecision(s)
if s.wants_human **then**
    $s \leftarrow$ EscalateWithConsent(s)
end if
return s

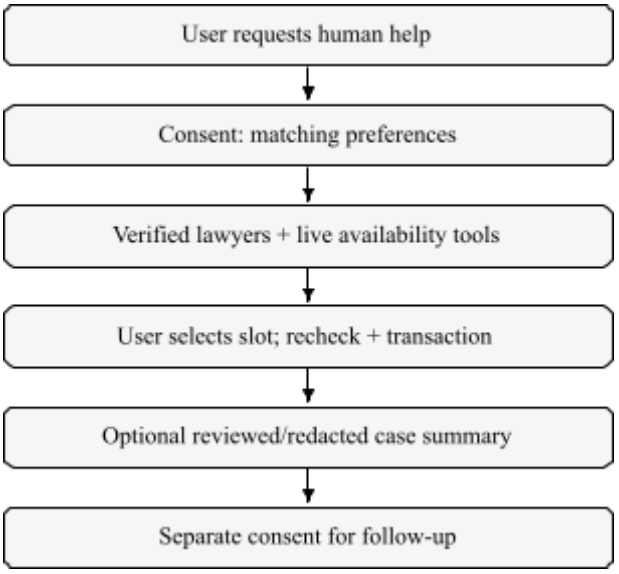

Fig. 3. Proposed consent-gated escalation; no lawyer or slot is generated by the LLM.

to next stage of rights analysis. It is operational auditing data rather than reasoning behind the tokens of the model.

E. Lawyer Matching and Scheduling (Proposed)

Once the permission is obtained on the acceptance of the help, the system will ask for the permission on the usage of the matching preferences. The LLM contains the practice domain which will be verified by the user, and the `find_lawyers` will look for the lawyers in the authorized database accord-ing to the specialty, language, geographic location, remote preference, and mode. The only available profiles from the database and slots from `check_availability` are avail-able. The user selects any one of those available slots and `create_appointment` process verifies the availability.

F. Consent and Privacy

Default to "Denial" and permissions that can be withdrawn. By default, case summaries are set to anonymize all personally identifiable information and require the consent of the user. Separate roles of access control are provided to users, attor-neys, and administrators. This has considered the provisions of the Digital Personal Data Protection Act, 2023 [26]. is informed by the Digital Personal Data Protection Act, 2023

[26] Privacy by design principle [27]; no certification related to legal compliance is issued. The process of issuing prediction and legal strategies is not done by NyayaAI because giving legal advice is the sole right of the lawyer under the Advocates Act, 1961. [28].

Algorithm 3 Consent-gated lawyer scheduling (proposed)

Require: Case, user preferences, date range

if not Consent(matching criteria) **then**
    return
end if
area $\leftarrow$ user-confirmed PracticeArea(case)
$C \leftarrow$ find_lawyers(area, preferences)
if $C = \varnothing$ **then**
    Relax location once; retry; otherwise notify
end if
Rank verified C by fit; retain top-n
$S \leftarrow$ check_availability(C, dates)
Present tool-returned slots; user selects
if selected slot is no longer free **then**
    Request reselection
end if
$a \leftarrow$ create_appointment(selection)
if Consent(case summary) **then**
    Share reviewed, redacted summary
end if
if Consent(notifications) **then**
    send_notification(a)
end if

VI. Evaluation Plan and Current Status

The Stage 1 has not been quantitatively evaluated in this research; the Stage 2 is currently in development and the first data set will be of lawyers generated by the simulation. Criteria specified in Table IV have been developed by the authors of the paper and are not compulsory and should undergo further evaluation by the experts. Evaluation will take place based on excerpts from selected sources and sanitized traces in relation to scope management, evidentiary citations of Article, removal of unmapped mappings, and operations based on the usage of tools, and consent before disclosure. The ablation study will consist of comparison of a flat retrieval to a parent-child retrieval, one agent to multi-stage workflows, and with and without verification and scope filtering settings. Multilingual review will enable the quality of the multilingual model evaluation, prompt injection and consent bypass will be used for safety evaluations and latency will be measured as well. The retrieval evaluation [29] and factuality assessment

[30] can be regarded as the methodological foundation for the research but do not offer any scores.

TABLE IV
AUTHOR-DRAFTED SCENARIOS FOR PLANNED EVALUATION

ID	Example query	Expected system behavior
S1	Driver unpaid for four months	Discuss possible Arts. 23/21 cau-tiously; note need for labour law
S2	Brother detained for 30 hours	Check Arts. 22/21; urge immediate qualified help
S3	School refuses admission on caste grounds	Check Arts. 15/21A and cite re-trieved passages
S4	"What is IPL?"	Reject as out of scope

VII. Discussion, Limitations and Future Work

In differentiating the retrieved constitution text, the reason offered by the model and the operational facts created from the database facilitate error localization, but this does not ensure correctness since there is a possibility of having faults such as irrelevant retrieval, wrong verification process, and wrong operational process configurations. Latency and costs are added because of the interactions among agents, and friction is caused because of the use of consent forms. Constitutions are only indexed; statutes, regulations, and cases are not indexed. Bias towards English embedding might limit cross-linguistic retrieval effectiveness. Sample scenarios are not many and not validated by domain experts. Models and speech API from other sources are dependencies, thus limiting the scaling of the system. Future directions include incorporation of statutes and case law corpora with provenance, multi-lingual embedding and re-ranking assessments, benchmarking by domain experts, locally trained models, adversarial validation, and collabora-tion with legal aid organizations.

VIII. Conclusion

NyayaAI Architecture The program is constructed according to the prototype of the constitution search and validation pro-cess, which consists of six agents and the consent-based five-agent validation process for the lawyers. Special features of the software include multilingual user interface of the software, source-based article mapping, process trace sanitization, and deterministic appointment. The performance of the software cannot be measured quantitatively as there is no quantitative analysis of this software anywhere.
