AI Usage & Governance Declaration

Statement on the Application and Boundaries of Local Generative AI

AI Methodology & Governance

This project incorporates Generative AI through locally executed Large Language Models (LLMs) via Ollama and dense embedding models from HuggingFace / BAAI.

Governance Principles Implemented:

1. Fully Offline Execution: No proprietary automotive engineering documents or design assets are transmitted to external cloud APIs or remote servers.

2. Grounded Retrieval Constraints: The LLM is restricted to synthesize responses solely from verified document chunks extracted into the local ChromaDB vector store.

3. Anti-Hallucination Guardrails: Prompts strictly mandate source citations [Source: , Page] and instruct the model to explicitly declare insufficient evidence when data is absent.

4. Human-in-the-Loop Review: All AI-extracted component dependencies are flagged as 'Candidate' until confirmed by a qualified automotive systems engineer.

Compliance Statement

Compliance Standard: Responsible Automotive AI Framework
Verification Date: October 15, 2026
